

# The Altitude and Median of an Isosceles

Harmony Van Nevele

April 27, 2015

**Theorem H.** Let  $ABC$  be an isosceles triangle and  $X$  be a point on side  $BC$ . If a segment  $AX$  makes two right angles  $AXC$  and  $AXB$ , then sides  $BX$  and  $CX$  will be congruent.

*Proof.* Let  $ABC$  be an isosceles triangle and segment  $AX$  make two right angles  $AXC$  and  $AXB$ . Since  $ABC$  is an isosceles triangle, we know that sides  $AC$  and  $AB$  are congruent and angles  $ACB$  and  $ABC$  are congruent by Euclid's book I, proposition 5. Since these sides and angles are congruent and angles  $AXC$  and  $AXB$  are congruent because they're both right angles, the triangles must be congruent by Euclid's book I, proposition 26. Since triangles  $ACX$  and  $ABX$  are congruent triangles, then sides  $CX$  and  $BX$  must also be congruent.
